product

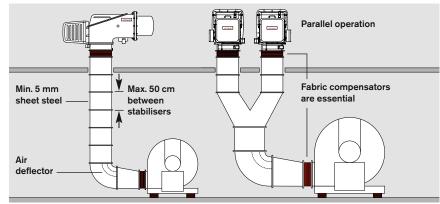

Information on WK-series burners

WK-series industrial burners

WK 40 to WK 80 burners • 300 kW to 28,000 kW

The powerful industrial burner with a modular construction

Combustion-air ducting

Weishaupt WK-series burners have been designed especially for industrial use. The modular design of the burners, coupled with their large capacity range, makes them ideally suited to a broad spectrum of special applications.

Modular principle

Weishaupt WK-series industrial burners are of modular design. That means the fan, pump station, and preheater station are all selected independently of the burner. This concept offers a high degree of flexibility in matching to the most diverse applications.

Digital combustion management

Digital combustion management ensures the simple and safe operation of combustion plant. Emissions are minimised and economy is maximised.

Insulated burner housing

The burner housing is fitted with internal insulation as standard. This significantly reduces the surface temperature of the housing during operation with preheated combustion air. The insulation also provides effective noise reduction.

Heat recovery using preheated combustion air

Many industrial processes create high flue-gas temperatures due to the high temperature of the medium used. A heat exchanger in the flue can be used to reclaim a large amount of energy from these hot flue gases, increasing efficiency by up to 10 %. Weishaupt WK-series industrial burners can be operated with preheated combustion-air temperatures of up to 250 °C.

Nozzle-head shut-off device

At burner shutdown, or when changing over to gas operation, a safety shut-off device located in the oil atomising system shuts off the oil flow directly in the nozzle orifice, preventing the escape of any oil.

Modulating operation

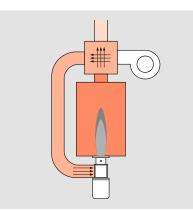

Within its operating range, the burner's output is matched to the current heat demand.

Reduced capacity at start-up

A gas pilot line enables all gas-firing burners and WK(G)MS 80 burners up to 17.5 MW to start operation at a reduced ignition load. This means that only a small quantity of gas flows into the combustion chamber. After the ignition phase, the burner drives to partial load.

Controlled shutdown from partial load

Controlled shutdown of the burner always takes place from the partial-load position, thus preventing impact on the gas main.

Combustion air temperatures up to 250 °C

Fuels

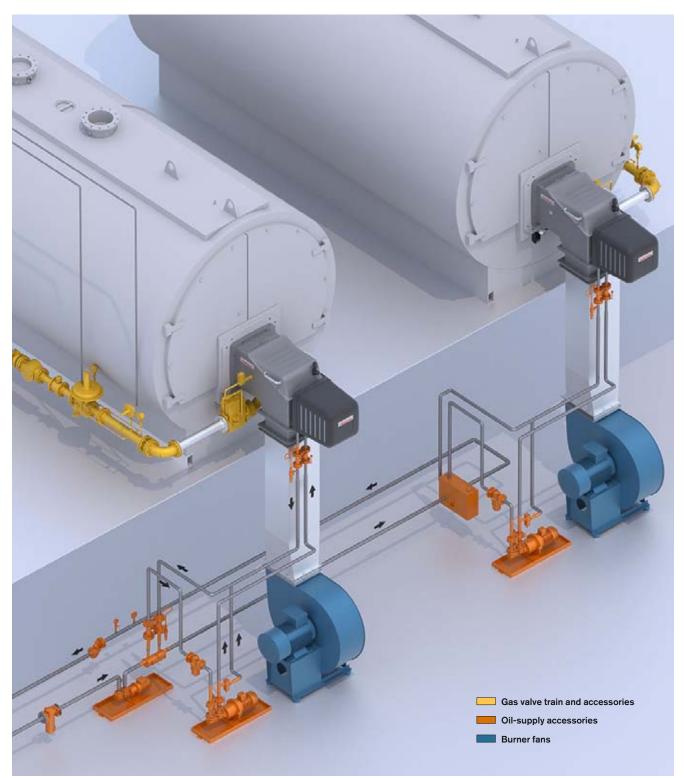

- Fuel oil EL (< 6 mm²/s at 20 °C) in accordance with DIN 51 603-1
- Fuel oil S (< 60 mm²/s at 100 °C) (< 700 mm²/s at 50 °C)
- in accordance with DIN 51 603-3/-5 • Natural gas E
- Natural gas LL
- LPG B/P

Permissible ambient conditions

- Ambient temperature during operation: -15 to +40 °C
- Humidity: max. 80 % relative humidty, no condensation
- Standard burner protection: IP 54

Standards conformity

- EN 267 and EN 676
 Pressure Equipment Directive, 97/23/EC
- Gas Appliance Directive, 2009/142/EC
- Machinery Directive, 2006/42/EC
- Electromagnetic Compatibility Directive, 2004/108/EC
- Low Voltage Directive, 2006/95/EC
- The burners are marked with a
 CE mark
 - CE Product ID No.
 - Type-test No.

Digital combustion management: Precise, simple, and reliable

Setting via the control and display unit

Digital combustion management means optimal combustion figures, continuously reproducible setpoints, and ease of use.

Weishaupt WK-series burners are equipped as standard with electronic compound regulation and digital combustion management. Modern combustion technologies demand a precise and continually reproducible dosing of fuel and combustion air.

Simple operation

Setting and control of the burner is achieved using a control and display unit. This is linked to the combustion manager via a bus system, enabling the user-friendly setting of the burner. The control and display unit has a clear text display with a choice of languages. An English/Chinese dual-screen version is available as an option should a Chinesecharacter display be desired.

Flexible communication options

The integrated interface enables all necessary data and functions to be relayed to a master control system. If required, a modem can be installed to allow for remote operation, monitoring, and diagnosis.

Measures for saving energy and increasing safety and reliability

Electronic compound regulation with the W-FM 100 and 200 combustion managers facilitates the extremely precise, hysteresis-free setting of the burner. The burner can be adjusted for ideal combustion figures throughout its entire capacity range. This reduces flue-gas losses and saves fuel.

Digital combustion management overview	W-FM 100	W-FM 200
Continuous operation > 24 h	•	•
Capacity control for temperature or pressure	Optional	•
Setpoint input (0)4-20 mA / 0-10 V (temperature/output)	Optional	•
O_2 trim with QGO20/21 O_2 probe		•
Combined CO/O ₂ control		Optional
VSD		•
Flue gas recirculation (temperature compensated)		•
WK(G)MS 80 with gas ignition		•
WKMS 80 with light-oil ignition	•	•
SQM40/48/9 servomotors in electronic compound (max.)	x 4	x 6
W-FC 4.0 flame monitoring	•	•
W-FC 5.0/6.0 flame monitoring		•
Parallel burner firing (in conjunction with KS controller)	Optional	•
Two gaseous fuels (also in combination with a liquid fuel)		•
Two liquid fuels with different calorific values	x 2 •	x 2 •

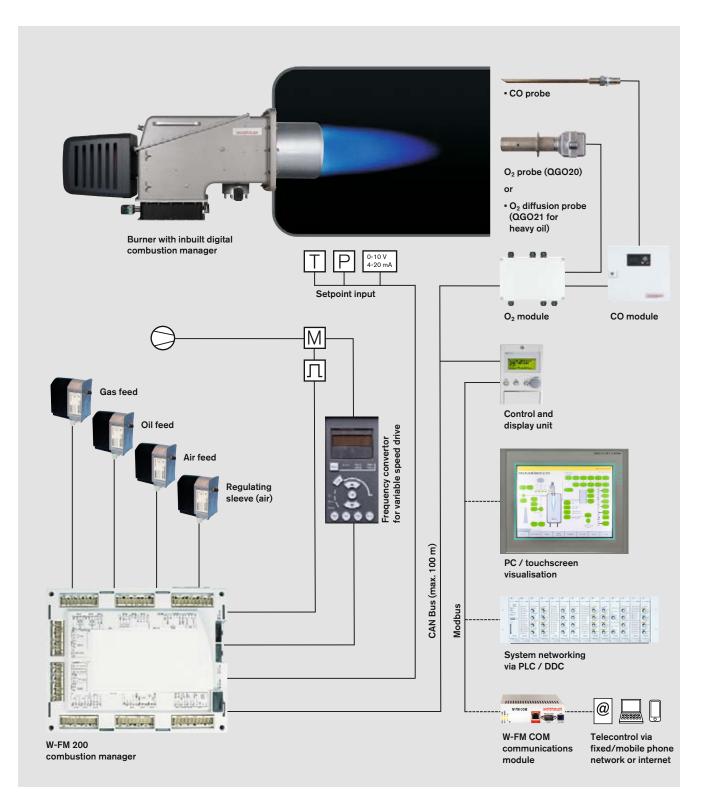

Variable speed drive reduces electrical consumption and facilitates a soft start of the combustion air fan. The use of VSD also reduces noise emissions by a considerable amount.

 O_2 trim saves fuel through a continual and extremely efficient optimisation of the combustion air. Different O_2 probes are available, providing suitable solutions for almost all fuels in applications with flue-gas temperatures below 300 °C.

Combined CO/O₂ control ensures an ultimate degree of safety. CO emissions are continually monitored and, if the defined limit is exceeded, the burner is operated with an increased amount of excess air for a short period of time before the O_2 trim returns the burner to its preset O_2 setpoint. Should external influences prevent a noncritical condition from being reached, then the burner will undergo a controlled shutdown.

Digital combustion management makes burner operation simple and reliable:

- Ready-to-connect, tested, and preset unit
- One unit for all burner variantsPrecise control for optimal
- combustion figures Integral valve proving
- (gas-fired burners)
- Integral capacity controller/ analogue signal convertor
- Clear text display with a large choice of languages for simple operation
- Flexible communication options thanks to a variety of interfaces (Modbus / Profibus)

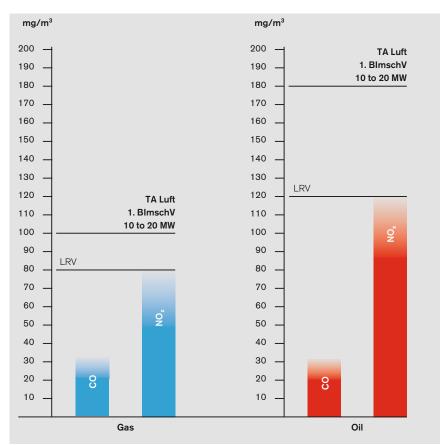

Emissions reduced by the multiflam[®] principle

Weishaupt's multiflam[®] technology was designed for gas and dual-fuel burners. By using a patented 3LN mixing head, NO_x emissions on WK-series burners can be reduced to extremely low levels.

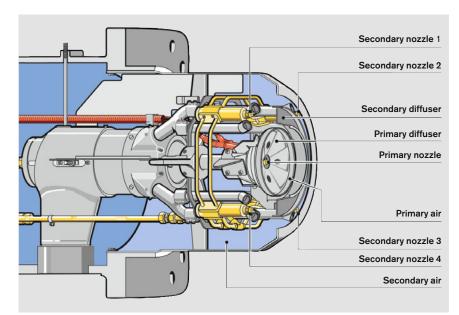

Weishaupt has set an all-new benchmark, achieving levels below 80 mg/m^3 on gas and 120 mg/m^3 on oil, subject to the combustion-chamber geometry.

Weishaupt's multiflam[®] burners meet the world's toughest standards. In those countries with particularly stringent environmental legislation, such as Switzerland, multiflam[®] industrial burners are market-sector leaders.

At the heart of Weishaupt's multiflam[®] technology is a special mixing-assembly design which distributes the fuel among primary and secondary nozzles. This results in extremely efficient combustion thanks to recirculation of the flue gases directly at the mixing assembly.

Typical emission levels for hot-water plant

Cut-away illustration of the mixing assembly

Flame monitoring for demanding safety requirements

Testing and optimisation using a software tool

Weishaupt Flame Control (W-FC) is a reliable flame monitoring system designed for demanding safety requirements.

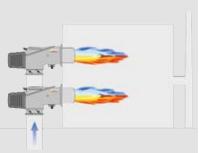

Version W-FC 4.0 is for plant with multiple burners firing from the same direction into a single combustion chamber. The W-FC assembly utilises flame frequency to monitor each flame separately via a load-independent on and off threshold for each fuel. The CFC3000 flame sensor functions in series with the QRA73 flame sensor on the W-FM 100/200 combustion manager.

Version W-FC 5.0 is for plant with multiple burners firing from different directions into a single combustion chamber, and for process plant with various flame sources. The W-FC assembly monitors each flame separately via a load-dependent switching threshold for each fuel. This guarantees a distinct differentiation from extraneous sources. The CFC3000 flame sensor functions in parallel with the QRA73 flame sensor on the W-FM 200 combustion manager. This convenient, load-dependent setting of the on and off thresholds rests upon the electronic VLoad module, which can be configured using software.

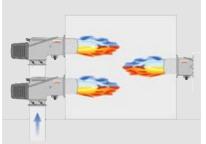

Version W-FC 6.0 is to monitor flame stability on plant with flue-gas recirculation for extreme NO_x requirements. With this W-FM 200based version, the QRA73 flame sensor monitors the flame while the CFC3000 controls the flue gas volume in accordance with the stability of the flame to ensure safe operating conditions. In this way, reliability of operation with optimal emissions is achieved under varying conditions. The VLoad module enables a load-dependent switching threshold to be tailored to the operational situation.

Simplified flue-gas recirculation is only designed for use with gaseous fuels.

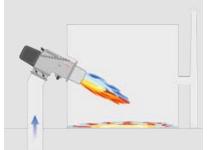

All versions meet EN 298 continuous operation requirements.

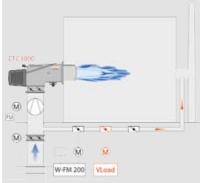

W-FC 4.0: e.g. all types of water-tube boiler

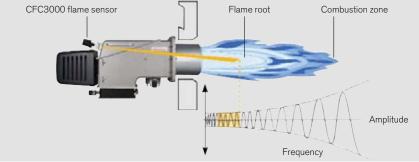

W-FC 5.0: e.g. all types of water-tube boiler

W-FC 5.0: e.g. waste incineration, biomass, process plant, etc.

W-FC 6.0: Plant with extreme NO_x requirements, e.g. hot-air, thermal-fluid, etc.

Alignment of the CFC3000 enables the detection range to be optimised

Pilot-line variants for every fuel and rating

Weishaupt offers various pilot-line variants in order to ensure maximum reliability of ignition.

Standard ignition for gaseous and

Optimal ignition when firing highly

The particularly low rating of $\sim 30 \text{ kW}$

makes reliable operation with natural

gas and bottled LPG possible. Flame monitoring is via a separate ionisation probe, which necessitates the use of a W-FM 200 combustion manager.

viscous liquid fuels, using a

liquid fuels on WK 40-70.

Variant A

Variants B to D

ignition burner

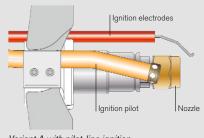

The pilot line feeds a controlled amount of gas to the ignition electrodes. Liquid fuels are ignited directly by the ignition electrodes

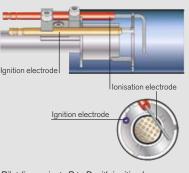

This reliable solution was developed especially for heavy and special fuel oils with widely varying characteristics. It is also suitable for extreme ignition conditions, such as cold-starting plant with preheated combustion-air temperature.

WKG 40 and 70, version LN, gas-side

WKGMS 80, gas-side

Oil and gas-fired with gas pilot line, pilot line switchable between natural gas and LPG (optional, standard: oil = LPG pilot line, Gas = natural gas pilot line before V1) For other pilot variants see page 16

Layout of the valve train

On boilers with hinged doors, the valve train must be mounted on the opposite side to the boiler-door hinges.

Compensator

To enable a tension free mounting of the valve train, the fitting of a compensator is recommended.

Support of the valve train

The valve train should be properly supported in accordance with the site conditions. See the Weishaupt accessories list for various valve-train-support components.

We're right where you need us

The security of a comprehensive service network

Weishaupt equipment is available from good HVAC specialists, with whom Weishaupt works in close partnership. To support the specialists, Weishaupt maintains a large sales and service network, ensuring equipment, spares and service are always available. Weishaupt are there when you need them. The service department is available to Weishaupt customers around the clock, 365 days a year. A Weishaupt office near you is standing by to answer all your heating questions.
